Subject: Prairie Creek Mine – Supplementary whole effluent toxicity testing (Memo 7)

1.0 INTRODUCTION

This document stems from technical discussions between regulators and CZN at Yellowknife on April 12, 2011.

In this memo, updated whole effluent toxicity testing results are presented. On April 28, 2011, new laboratory treated process water and treated mine water samples were prepared. These were submitted to Nautilus Environmental in Burnaby for additional acute *Daphnia magna* testing (Nautilus 2011c, Attachment A) and sub-lethal *Ceriodapnia duba* testing (Nautilus 2011d, Attachment B). Three mixtures of the treated mine water and treated process water were tested:

- A 4:1 (80% treated mine water: 20% treated process water) sample, representing worst case (uncommon) effluent concentrations;
- An 8:1 (71.4% mine, 12.4% process, 16.2% ditch) sample, representing more typical operating conditions; and
- Treated mine water only.

The acute (*D. magna*) and sub-lethal (*C. dubia*) results are discussed separately below. These two species were chosen because whole effluent testing using simulated effluent prepared on January 28, 2011 indicated either inconsistent results (*D. magna*) or toxicity at environmentally relevant concentrations (*C. dubia*) (Nautilus 2011a, Attachment C).

The results of a Toxicity Identification Evaluation (TIE, Nautilus 2011b, Attachment D) performed at the time indicated that the observed toxicity was likely not caused by divalent metals, non-polar organic compounds or strong anions. Instead, the results suggested that the cause of toxicity may have been attributable to the treatment of the simulated effluent.

The remaining species tested indicated no toxicity; there was no acute toxicity of 100% effluent to rainbow trout (96hr-LC50 test), and no sub-lethal toxicity to *Lemna minor (*7-day growth inhibition test, Nautilus 2011a, Attachment C).

2.0 DAPNIA MAGNA

The January 28 2011 *D. magna* test using the worst case (4:1) simulated effluent mixture yielded inconsistent results (Nautilus 2011a, Attachment C). One full-strength sample exhibited toxicity, while another did not. In addition, both the 4:1 and 8:1 mixtures diluted with Prairie Creek water showed increasing mortality at lower concentrations (Nautilus 2011b). This result was both unusual and unexplained. The 8:1 mixture and mine water-only sample did not cause any acute *Daphnia magna* toxicity at full strength.

The new treated process water and treated mine water samples were prepared to be representative of operational mine treatment conditions. The *D. magna* tests (Nautilus 2011c, attached) indicated no toxicity in any of the three mixtures tested above, suggesting that full-strength effluents discharged from the mine are unlikely to cause any acute toxicity.

3.0 CERIODAPHNIA DUBIA

The initial (January 28, 2011) *C. dubia* tests using both the 4:1 and 8:1 simulated effluent mixtures showed no mortalities, but there were effects on reproduction at all dilutions tested, down to and including 5% v/v (Nautilus 2011a, Attachment C). These results indicated that there could be sub-lethal impacts to Prairie Creek organisms downstream of the IDZ in Prairie Creek.

C. dubia toxicity testing with the new laboratory-prepared treated mine water and two simulated effluent mixtures provided the following results:

- There was no mortality seen in any of the tests;
- Treated mine water only (i.e., with no process effluent added) caused no effect on reproduction;
- In the 4:1 mixture (worst case), there was no effect on reproduction at 20% or lower, but a substantial effect at 40% and higher (an IC25 of 23.8 %v/v was calculated); and
- In the 8:1 mixture (typical case), there was no effect on reproduction at 40% and lower, and a substantial effect at 60% and higher (an IC25 of 44.5 %v/v was calculated).

These results indicate an absence of *C. dubia* mortality within the IDZ and absence of sub-lethal toxicological effect at concentrations expected to occur outside the IDZ. Since mixing in the vertical water column occurs very rapidly upon release, and no sub-lethal effects to *C. dubia* were observed below 23.8% v/v, it is likely that there would also be an absence of sub-lethal effect within much of the IDZ.

4.0 CONCLUSION

In conclusion, the compiled toxicity testing results indicate that the treated Prairie Creek mine effluent (process and mine water) will not result in any acute mortality within the IDZ and no sub-lethal effects outside the IDZ. These are prerequisites of establishing a suitable IDZ for a water discharge license. During periods of low winter flows final effluent will consist only of treated mine water, which caused no effect on *C. dubia* at even 100% treated mine water.

Dear Mr. Wilcockson:

Re: Toxicity testing on the samples identified as Mixture 4:1, Mixture 8:1, Mine Water (Collected on April 28, 2011)

Nautilus Environmental is pleased to provide you the results of the 48-h LC50 *Daphnia magna* toxicity tests on the above samples, received on April 28, 2011. Testing was conducted according to Environment Canada and 1/RM/14, (Second Edition, 2000). The results of these tests are provided in the table below and are based on the appended data. All acceptability criteria outlined in the Environment Canada protocol were met.

Table A. Results for the 48-h *D. magna* test.

Sample ID	Collection Date and Time	48-h LC50 (% v/v) [1]
Mixture 4:1	April 28, 2011 @ 1600h	>100
Mixture 8:1	April 28, 2011 @ 1600h	>100
Mine Water	April 28, 2011 @ 1600h	>100

[1] Results relate only to the sample tested.

Please feel free to contact the undersigned at 604-420-8773 should you have any questions or require any additional information.

Yours truly,

Nautilus Environmental

Krysta Banack, B.Sc.
Laboratory Biologist

LIST OF TABLES

LIST OF APPENDICES

1.0 INTRODUCTION

Nautilus Environmental conducted chronic toxicity tests for Hatfield Consultants on samples identified as Mine Water, Mixture 1 and Mixture 2. The mixtures were prepared in the laboratory on April 28, 2011, from samples identified as Process Water and Mine Water (received on April 28, 2011) and Ditch Water (received in December 2010).

Mixture 1 was a 4:1 combination of Mine Water (80%) and Mill Water (20%) and Mixture 2 was a combination of Mine Water (71.4%), Mill Water (12.4%), and Ditch Water (16.2%). The following toxicity tests were performed on the Mine Water, Mixture 1 and Mixture 2 samples:

- 7-d *Ceriodaphnia dubia* survival and reproduction test

This report describes the results of the toxicity tests. Copies of raw laboratory data sheets and statistical analysis are provided in Appendix A. A copy of the chain of custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity tests are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses for the tests were performed using CETIS (Tidepool Scientific Software, 2009).

2.1 Quality Assurance/Quality Control (QA/QC)

Nautilus follows a comprehensive QA/QC program to ensure that the data generated are of high quality and are scientifically defensible. To meet these objectives, Nautilus has implemented a number of quality control procedures that include the following:

- Negative controls to ensure that appropriate testing performance criteria are met;
- Positive controls to assess the health and sensitivity of the test organisms;
- Use of appropriate species and life stage to meet the study objectives;
- Appropriate number of replicates to allow proper statistical analyses;
- Calibration and proper maintenance of instruments to ensure accurate measurements;
- Proper documentation and recordkeeping to allow traceability of performance;
- Adequate supervision and training of staff to ensure that methods are followed;
- Proper handling and storage of samples to ensure their integrity;
- Procedures in place to address issues that may arise during testing and ensure the implementation of appropriate corrective actions; and
- Rigorous review of data by a Registered Professional Biologist to ensure they are of good quality and scientifically defensible prior to releasing to the client.

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	*Ceriodaphnia dubia*
Test organism source	In-house culture
Test organism age	<24 hr old neonates produced within 12 hr
Test type	Static renewal
Test duration	7 ± 1 day
Test chamber	20 mL test tube
Test solution volume	15 mL
Number of replicates	10
Control/dilution water	20% Perrier water (hardness 80-100mg/L $CaCO_3$)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Number of organisms/chamber	1
Feeding	Daily, with 0.1 ml *Pseudokirchneriella subcapitata* and 0.05 mL YCT
Light intensity	100 to 600 lux
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2007), EPS 1/RM/21
Test endpoints	Survival and reproduction
Test acceptability criterion for controls	≥80% survival; ≥15 young per surviving control; ≥60% of controls producing three or more broods
Reference Toxicant	Sodium chloride

3.0 RESULTS

There were no effects on survival of *Ceriodaphnia dubia*; the LC50 value for all these samples was >100%. Conversely, effects were observed on reproduction of *C. dubia* in both Mixtures 1 and 2. The IC50 was 28.4% for Mixture 1 and 49.8% for Mixture 2, respectively (Table 2). No adverse effects on reproduction were observed in the toxicity tests using Mine Water.

3.1 Quality Assurance/Quality Control

All the tests reported here met the acceptability criteria for test validity specified in the respective protocol. Water quality parameters measured during the toxicity tests were within acceptable ranges and results of the reference toxicant tests conducted during the testing program were all within the in-house historical mean and range. The reference toxicant test results are summarized in Table 3.

It should be noted that the Ditch water used in Mixture 2 was received in December 2010 and therefore exceeded holding time requirements.

Table 2. Toxicity test results for the *Ceriodaphnia dubia* survival and reproduction tests.

(% v/v)	Mine Water		Mixture 1		Mixture 2	
	Survival (%)	Reproduction (# offspring)	Survival (%)	Reproduction (# offspring)	Survival (%)	Reproduction (# offspring)

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Hatfield
Work Order No.: 11200

Start Date/Time: April 30, 2011 @ 1130h
Set up by: KLB

Sample Information:

Sample ID: Mine Water
Sample Date: April 28
Date Received: April 28
Sample Volume: 1x20L

Test Organism Information:

Broodstock No.: 041911
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 24
Mortality (%) in previous 7 d: 0.0
Individual female # used ≥8 young on test day: 1, 2, 4, 7, 8, 10, 12, 19, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 66
Stock Solution ID: 11NaCl
Date Initiated: April 20/11

7-d LC50 (95% CL): 2.1 (1.7-2.6) g/L NaCL
7-d IC50 (95% CL): 1.2 (1.1-1.5) g/L NaCL

7-d LC50 Reference Toxicant Mean (2SD Range): 1.8 (1.5-2.3) g/L NaCL CV (%): 11
7-d IC50 Reference Toxicant Mean (2SD Range): 1.2 (0.9-1.4) g/L NaCL CV (%): 12

Test Results:

	Survival	Reproduction
LC50 %(v/v) (95% CL)	>100	
IC25 %(v/v) (95% CL)		>100
IC50 %(v/v) (95% CL)		>100

Ceriodaphnia dubia Summary Sheet

Client: Hatfield
Work Order No.: 11200

Start Date/Time: April 29, 2011 @ 1000h
Set up by: KLB

Sample Information:

Sample ID: JAB Mine Water 8:1 Mixture
Sample Date: April 28, 2011
Date Received: April 28, 2011
Sample Volume: 1×20L

Test Organism Information:

Broodstock No.: 041911
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 23
Mortality (%) in previous 7 d: 0.0
Individual female # used ≥8 young on test day: 11, 12, 13, 14, 15, 16, 18, 19, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd66
Stock Solution ID: 11NaCl
Date Initiated: April 20/11

7-d LC50 (95% CL): 2.1 (1.7-2.6) g/L NaCl
7-d IC50 (95% CL): 1.2 (1.1-1.6) g/L NaCl

7-d LC50 Reference Toxicant Mean (2SD Range): 1.8 (1.5-2.3) g/L NaCl CV (%): 11
7-d IC50 Reference Toxicant Mean (2SD Range): 1.2 (0.9-1.4) g/L NaCl CV (%): 12

Test Results:

	Survival	Reproduction
LC50 %(v/v) (95% CL)	>100	
IC25 %(v/v) (95% CL)		44.5 (42.7-44.9)
IC50 %(v/v) (95% CL)		49.8 (48.2-50.4)

1.0 INTRODUCTION

Nautilus Environmental conducted acute and chronic toxicity tests for Hatfield Consultants on samples identified as Mixture 1 and Mixture 2, prepared on January 28, 2011. The mixtures were prepared in the laboratory from samples identified as Process Water, Mine Water and Ditch Water.

Mixture 1 was a 4:1 combination of Mine Water (80%) and Mill Water (20%) and Mixture 2 was a combination of Mine Water (77%), Mill Water (11%), and Ditch Water (12%), reflecting a 7:1 ratio of Mine to Mill Water, with a small contribution of Ditch Water. The following toxicity tests were performed on the Mixture 1 and Mixture 2 samples:

- 7-d *Ceriodaphnia dubia* survival and reproduction test
- 7-d *Lemna minor* growth inhibition test
- 96-h rainbow trout (*Oncorhynchus mykiss*) acute toxicity test (conducted with lab water and Prairie Creek water as dilution water)
- 48-h *Daphnia magna* acute toxicity test (conducted with lab water and Prairie Creek water as dilution water)

In addition, a single concentration screening test was conducted with *D. magna* on the full-strength Mine Water sample. Due to a technician error in producing Mixture 2, there was insufficient volume of remaining Mine Water sample available to conduct a 96-h single concentration screening test with rainbow trout.

This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analysis for each test species are provided in Appendices A through F.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 through 6. Testing was conducted according to procedures described by Environment Canada (2000a, 2000b, 2007a and 2007b).

Statistical analyses for the tests were performed using CETIS (Tidepool Scientific Software, 2009).

2.1 Quality Assurance/Quality Control (QA/QC)

Nautilus follows a comprehensive QA/QC program to ensure that the data generated are of high quality and are scientifically defensible. To meet these objectives, Nautilus has implemented a number of quality control procedures that include the following:

- Negative controls to ensure that appropriate testing performance criteria are met;
- Positive controls to assess the health and sensitivity of the test organisms;
- Use of appropriate species and life stage to meet the study objectives;
- Appropriate number of replicates to allow proper statistical analyses;
- Calibration and proper maintenance of instruments to ensure accurate measurements;
- Proper documentation and recordkeeping to allow traceability of performance;
- Adequate supervision and training of staff to ensure that methods are followed;
- Proper handling and storage of samples to ensure their integrity;
- Procedures in place to address issues that may arise during testing and ensure the implementation of appropriate corrective actions; and
- Rigorous review of data by a Registered Professional Biologist to ensure they are of good quality and scientifically defensible prior to releasing to the client.

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test organism	*Ceriodaphnia dubia*
Test organism source	In-house culture
Test organism age	<24 hr old neonates produced within 12 hr
Test type	Static renewal
Test duration	7 ± 1 day
Test chamber	20 mL test tube
Test solution volume	15 mL
Number of replicates	10
Control/dilution water	20% Perrier water (hardness 80-100mg/L $CaCO_3$)
Test solution renewal	Daily
Test temperature	25 ± 1°C
Number of organisms/chamber	1
Feeding	Daily, with 0.1 ml *Pseudokirchneriella subcapitata* and 0.05 mL YCT
Light intensity	100 to 600 lux
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2007a), EPS 1/RM/21
Test endpoints	Survival and reproduction
Test acceptability criterion for controls	≥80% survival; ≥15 young per surviving control; ≥60% of controls producing three or more broods
Reference Toxicant	Sodium chloride

Table 2. Summary of test conditions: *Lemna minor* growth inhibition test.

Test organism	*Lemna minor*
Test organism source	In-house culture
Test organism age	7- to 10-day old
Test type	Static
Test duration	7 days
Test chamber	250-mL glass containers
Test solution volume	150 mL
Number of replicates	4
Control/Dilution water	Deionized or distilled water with nutrients added
Test solution renewal	None
Test temperature	25 ± 2°C
Number of organisms/chamber	Two 3-frond plants
Light intensity	3600 to 4400 lux full spectrum light
Photoperiod	Continuous
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Test endpoint	Number of fronds and dry weight
Test acceptability criteria for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride

Table 3. Summary of test conditions: 96-h rainbow trout test.

Test organism	*Oncorhynchus mykiss*
Test organism source	Commercial hatchery
Test organism age	Juveniles
Test type	Static
Test duration	96 hours
Test chamber	20 L glass aquarium
Test solution volume	10 L
Number of replicates	1
Control/Dilution water	Dechlorinated municipal tapwater; and Prairie Creek Water
Test solution renewal	None
Test temperature	15 ± 1°C
Number of organisms/chamber	Ten
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light/8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test protocol	Environment Canada (2000a), EPS 1/RM/13
Test endpoint	96-h LC50
Test acceptability criteria for controls	Survival ≥ 90%
Reference toxicant	Sodium dodecyl sulphate

Table 4. Summary of test conditions: 48-h *Daphnia magna* test.

Test organism	*Daphnia magna*
Test organism source	In-house culture
Test organism age	< 24 h
Test type	Static
Test duration	48 hours
Test chamber	250-mL glass beakers
Test solution volume	200 mL
Number of replicates	Three (Single Concentration Screening), One (LC50)
Control/Dilution water	Moderately-hard reconstituted water (hardness 80-100 mg/L); and Prairie Creek Water
Test solution renewal	None
Test temperature	20 ± 2°C
Number of organisms/chamber	Ten
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2000b), EPS 1/RM/14
Test endpoint	48-h LC50
Test acceptability criteria for controls	Survival ≥ 90%
Reference toxicant	Sodium chloride

3.0 RESULTS

Effects on survival of *Ceriodaphnia dubia* were minimal; the LC50 value for both samples was >100%. Conversely, effects were observed on reproduction of *C. dubia* in all concentrations of both Mixtures 1 and 2. The IC25 was <5% in both samples, and the IC50 was <5% for Mixture 1 and 16.1% for Mixture 2, respectively (Table 5). These values indicate that more than a 25% reduction in reproduction was observed in all test concentrations of both mixtures (the lowest test concentration was 5% sample).

The *Lemna minor* growth inhibition test exhibited enhanced growth in all test concentrations compared to the negative control for both Mixture 1 and Mixture 2 (Table 6). The IC25 and IC50 values for both samples were >97%, indicating that there was no evidence of an adverse toxicological effect associated with either of the samples to this species.

Acute toxicity tests using rainbow trout tests exhibited 100% survival in all concentration tested with Mixtures 1 and 2, using both dechlorinated and Prairie Creek water for dilution (Tables 7 and 8). Therefore the 96-h LC50 results were >100%, and there was no evidence of an adverse toxicological effect to this species.

Acute toxicity tests using *Daphnia magna* resulted in an LC50 value of 89% for Mixture 1 and >100% for Mixture 2 when diluted with laboratory-prepared moderately hard water (Table 9). The samples diluted with Prairie Creek water exhibited an unusual pattern of mortality in both tests; specifically, elevated mortality was observed at the lower concentrations of sample, and not in higher concentrations (Table 10). This is an unusual result, since you would typically anticipate a larger adverse effect associated with a larger dose, and in this case, the opposite occurred. This finding suggests that toxicity occurred as a result of some interaction between the water types. Regardless, the fact that mortalities were not observed in the higher concentrations of sample tends to suggest that this was not indicative of a substantial degree of toxicity in the samples.

It should be noted that the full-strength Mixture 1 elicited a 60% reduction in survival of *Daphnia magna* in one test (the one using moderately hard water) and no reduction in survival in the other (using Prairie Creek water for dilution). Since there is no dilution in the full-strength sample, these two treatments are equivalent to one another, and reflect two, somewhat different measures of effect in the Mixture 1 sample. Based on the partial effect observed in one of the

two tests, and the lack of effect in the second test, it would appear that this mixture contained a toxicant at close to its threshold for toxicity to this species.

In the *Daphnia magna* 48-h single concentration screening test with Mine Water, survival was 100% in the undiluted sample, indicating that the Mine Water did not exhibit an adverse effect on this species (Table 11).

Collectively, the results indicated that rainbow trout and duckweed were not sensitive to the samples. Conversely, *C. dubia* displayed a substantial reduction in reproduction in both mixtures, with a greater adverse effect associated with Mixture 1 than Mixture 2. Consistent with this finding, Mixture 1 exhibited a small degree of adverse effect on survival of *D. magna*, whereas Mixture 2 did not. These results suggest that the toxicity observed to cladocerans was from the Mill Water sample, since Mixture 1 contained a higher concentration of Mill Water than Mixture 2. This conclusion is supported by the fact that the full-strength Mine Water did not have any adverse effect on *D. magna*.

3.1 Quality Assurance/Quality Control

All the tests reported here met the acceptability criteria for test validity specified in the respective protocol. Water quality parameters measured during the toxicity tests were within acceptable ranges and results of the reference toxicant tests conducted during the testing program were all within the in-house historical mean ± two standard deviations. The reference toxicant test results are summarized in Table 12.

It should be noted that the samples produced for this testing project were derived from samples that had been collected previously, and treated in a manner that was similar to that anticipated at the mine site. Consequently, holding times associated with these samples exceeded those specified in the test methods. However, the time period in between preparation of the treated Mine and Mill Water samples and initiation of the toxicity tests fell within the required holding times associated with the various tests.

Ceriodaphnia dubia Summary Sheet

Client: Hatfield
Work Order No.: 11 066

Start Date/Time: Jan 30/11 @ 1115
Set up by: KLB

Sample Information:

Sample ID: Mixture 2
Sample Date: Jan 28/11
Date Received: Jan 28/11
Sample Volume: 2 x 2 L

Test Organism Information:

Broodstock No.: 01181
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 28
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day: 1, 2, 4, 5, 6, 7, 8, 10

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 63
Stock Solution ID: 10 NaCl
Date Initiated: ~Jan 29/11

7-d LC50 (95% CL): 1.7 (1.3 - 2.3) g/L NaCL
7-d IC50 (95% CL): 1.1 (0.9 - 1.4) g/L NaCL

7-d LC50 Reference Toxicant Mean (2SD Range): 1.8 (1.4 - 2.3) g/L NaCL CV (%): 12
7-d IC50 Reference Toxicant Mean (2SD Range): 1.2 (0.9 - 1.5) g/L NaCL CV (%): 13

Test Results:

	Survival	Reproduction
LC50 %(v/v) (95% CL)	> 100	
IC25 %(v/v) (95% CL)		~~3.5 (2.2 - 10.5) AC~~ 4.0 (2.4 - 10.8)
IC50 %(v/v) (95% CL)		16.1 (~~13.7~~ 12.3 - 20.8)

1.0 INTRODUCTION

Toxicity tests conducted on two mixtures of Mine Water and Mill Water produced to reflect future anticipated conditions at the Canadian Zinc operation indicated that reproduction of the freshwater cladoceran, *Ceriodaphnia dubia,* was adversely affected by the mixtures. Conversely, rainbow trout and duckweed were not adversely affected in acute and chronic tests, respectively, and only a marginal adverse effect was apparent in one of the mixtures using acute tests with *Daphnia magna*. The results of these tests are provided in a separate test report.

Adverse effects on reproduction of *Ceriodaphnia* appeared to be derived from the Mill Water, since the degree of toxicity observed was related to the proportion of Mill Water in the samples, and the Mine Water tested alone exhibited no adverse effect on *Daphnia*. Consequently, efforts were undertaken to establish the cause of toxicity to *Ceriodaphnia* in the Mill Water using a Toxicity Identification Evaluation. This process involves conducting a series of physico-chemical manipulations on the sample, following by toxicity tests on the treated and untreated samples. Alterations in the degree of toxicity present as a result of the treatments provides an indication of the characteristics of the contaminant that is responsible for toxicity in the sample. The actual identity of the toxicant can then be established through a series of follow-up procedures.

2.0 METHODS

The following treatments were conducted:

EDTA treatment – Chelation of the sample with EDTA was used to identify whether divalent metals, such as copper, cadmium and zinc, were responsible for toxicity. This chemical binds to divalent metals and reduces their bioavailability and, therefore, toxicity. Treatments were conducted at 5 mg/L EDTA.

C18 solid phase extraction – Treatment of the sample through a C18 substrate was utilized to identify whether toxicity was caused by a non-polar organic contaminant. This material binds and removes these materials and, therefore, if toxicity is reduced following treatment with C18, this indicates that organic contaminants are responsible for toxicity.

Anion Exchange – Extraction of the sample through a strong anion exchange column was used to establish whether strong anions were responsible for toxicity. This treatment is similar to the

C18 treatment, except that the substrate contains positively charged amine groups which have an affinity for anions in the sample. Anions that would be expected to be removed include anionic surfactants, but not major anions such as sulphate, carbonate or chloride.

Filtration – Filtration of the sample through a 0.45 µm filter was conducted to remove particulate-bound contaminants.

pH adjustment – Adjustment of the pH of a sample can alter the characteristics of the toxicant, resulting in an alteration in toxicity, or a change in the effectiveness of other TIE procedures. In this case, adjustment of the pH of the sample to 5 and 9 was used in conjunction with C18 and anion exchange in an attempt to establish whether the toxicant exhibited a higher affinity for these materials under different pH conditions. In addition, the sample was filtered after adjustment to pH 10, which would be expected to remove metals, such as zinc.

In order to evaluate the potential contribution to toxicity of a flocculent (Magnafloc 10) that was used in preparation of the sample, a sample of this chemical was obtained from SGS and evaluated for toxicity using *Ceriodaphnia*.

Test procedures used here were consistent with those typically applied for chronic tests using this species, with the exception that the degree of replication was reduced from 10 to 5. This stream-lining of the procedure is appropriate in Toxicity Identification Evaluations, where the purpose is to look for substantial changes in effect as a result of the treatments.

3.0 RESULTS

Initial treatments were conducted on the Mill Water sample diluted to 10%. None of the treatments (filtration, C18 extraction, anion exchange and EDTA) had an appreciable effect on toxicity to *Ceriodaphnia*, indicating that toxicity did not appear to be caused by particulate-bound contaminants, non-polar organic contaminants, strong anions, or divalent metals (Table 1).

These treatments were repeated using a sample diluted to 5% in case there had been too much toxicity present in the 10% sample for the treatments to be effective; however, the results of these treatments were not useful because the reproduction in the untreated sample diluted to 5% (21.2 ± 1.8 offspring per adult) were not significantly lower than the control (22.8 ± 2.9 offspring per adult). Thus, since the 5% sample did not exhibit toxicity, no information with respect to the cause of toxicity could be obtained from these treatments.

Adjusting the pH of the sample to 5 or 9 prior to treatment using C18 and anion exchange did not improve the effectiveness of these treatments at reducing toxicity in the 10% sample. Results of these treatments are also shown in Table 1. These results did not provide further indication as to the cause of toxicity, but are consistent with the initial findings described above.

The results described above are consistent with a number of contaminants, including charged or highly soluble organic contaminants, cations, total dissolved solids, and other chemicals. In order to establish whether one of the process chemicals used in preparation of the samples might have been responsible, the characteristics of the materials were reviewed and Magnafloc 10 was identified as being potentially consistent with the results, and of unknown toxicity to *Ceriodaphnia*. The results of a toxicity test conducted using this chemical are provided in Table 2; in general, this chemical resulted in no adverse effect on reproduction at 1.25 mg/L or less, but reduced reproduction was observed in the 2.5 and 5 mg/L solutions. Since the treatment rate of this material was 14 mg/L in the Mill Water, and most of the material would be expected to be removed during the treatment process, it appears unlikely that this was the cause of toxicity.

Table 1. Results of TIE treatments conducted on 10% Mill Water.

	Survival (%)	Reproduction (offspring per adult)
Control	100	23.6 ± 5.2
Untreated	100	1.2 ± 1.8
Filtered sample	100	1.0 ± 1.4
C18-treated sample	100	0.6 ± 1.3
Anion Exchange-treated sample	100	2.6 ± 1.8
EDTA treated sample	100	0.0 ± 0.0
Control	100	18.0 ± 3.3
Untreated	100	0.0 ± 0.0
pH 5 + anion exchange	100	0.0 ± 0.0
pH 9 + anion exchange	100	0.0 ± 0.0
pH 5 + C18	100	0.0 ± 0.0
pH 9 + C18	100	0.0 ± 0.0
pH 10 + filtration	100	1.4 ± 1.9

Table 2. Results of toxicity test conducted on Magnafloc 10.

Mangafloc 10 (mg/L)	Survival (%)	Reproduction (offspring per adult)
Control	100	21.8 ± 6.6
0.08	100	22.2 ± 10.1
0.16	100	25.0 ± 2.0
0.31	100	20.8 ± 4.2
0.62	100	20.8 ± 6.9
1.25	100	20.2 ± 4.3
2.5	100	14.0 ± 5.7
5.0	100	13.2 ± 2.7

4.0 DISCUSSION

The results of the TIE procedures described here were not conclusive in establishing the cause of toxicity in the Mill Water; however, the results indicate that non-polar organic contaminants, strong anions and divalent metals did not appear to be the primary cause of toxicity in the sample, although it should be noted that these materials may have contributed to toxicity at higher concentrations of sample.

The concentration of sulphate present in the Mill Water would most likely have contributed some portion of the adverse effect observed to *Ceriodaphnia*. For example, Elphick et al. (2011) reported an IC25 value for effects of sulphate for this species of 1212 mg/L sulphate at a hardness of 160 mg/L. Since the Mill Water contained 4500 mg/L sulphate, there was clearly sufficient sulphate present to cause some proportion of the observed effect. Total dissolved solids, in general, which includes sulphate and other major ions, such as calcium, magnesium, sodium, potassium, chloride and carbonate causes effects on this species when elevated as a result of osmotic stress, and so sulphate, or major ions in general, likely explains some of the observed effect. However, the sample diluted to 10% would likely not have contained sufficient major ions to explain the effect observed in the diluted sample.

The Mill Water exhibited toxicity to *Ceriodaphnia* in the sample diluted to 10%, but not when tested at 5%. This result differs somewhat from the initial tests using the Mixtures, in which toxicity was observed in all concentrations tested, as low as 5% sample. Since the Mixtures were comprised of only a portion of Mill Water, the adverse effect observed here with the Mill Water is not consistent with the extent of adverse effect observed in the mixtures. This implies that either: 1) the toxicity of the Mill Water dissipated in between when the original test was conducted and when the TIE treatments were performed; 2) other components of the mixtures (i.e., Mine Water) also contributed to toxicity in the mixtures; or 3) there was some interaction between components in the mixture that exacerbated toxicity. The most likely explanation would be that toxicity dissipated over time in the sample; however, additional investigation would be necessary to fully characterize and identify the cause of toxicity in this sample.
