D1 INTRODUCTION

This appendix presents a description of the naming convention for lakes in the Lac du Sauvage basin and the adjacent Paul Lake basin, followed by a detailed basin map and tables presenting physical characteristics of individual lakes and sub-basins.

D1.1 Naming Convention

The Lac du Sauvage basin has a drainage area of approximately 1,500 (square kilometres) km², and includes Lac du Sauvage and small, direct tributaries (Basin A), 10 major tributary sub-basins (Basins B to L), and the adjacent Paul Lake basin (Basin P). The number of lakes and connecting channels required that a rational and easily understood naming convention be developed and applied to this large and complex basin, for use by all technical disciplines.

The following rules were applied to lake and basin naming:

- 1) Major sub-basins were identified using a capital letter (i.e., A, B, C...). The local Lac du Sauvage sub-basin was designated as the "A" basin. Tributary sub-basins identified during the basin study were designated as B through L, with the first sub-basin located immediately north of the Lac du Sauvage outlet and the sequence proceeding in a clockwise direction around Lac du Sauvage.
- 2) The local Lac du Sauvage sub-basin was broken into sub-sub-basins, designated using an additional lower case letter (i.e., Aa, Ab, Ac...). These were designated according to internal basins as identified by the available coarse bathymetry, and the sequence followed the direction generally from southeast basin to northwest.
- 3) Lake names were designated by the basin letter and lake number (i.e., L1, L2, L3...). The sequence started at the terminal lake of each sub-basin and proceeded to the headwater lake on the mainstem of the sub-basin. The sequence then continued from the first branch on the headwater chain, upstream from the sub-basin outlet, then the second branch, and so on. Non-draining lakes were assigned numbers according to the branch that they were closest to.
- 4) Lake names for within Lac du Sauvage sub-basins (i.e., Ab1, Ab2, Ab3...) proceeded on a branch-by-branch basis, clockwise through each sub-basin.

This naming convention was applied to mapping generated before the 2013 field season, to facilitate field programs and to allow hydrological modelling to proceed. During the 2013 field program, collection of light detection and ranging (LiDAR) data and subsequent redefinition of basin boundaries meant that some lakes and basins needed to be re-named, primarily due to lakes shifting from one basin to another or due to differences in lake connectivity from that identified by National Topographic Database mapping.

In some instances, this re-naming resulted in non-sequential numbering of lakes and basins, where lakes moved out of a sub-basin were simply deleted in that sub-basin and added to the correct sub-basin. No lakes or basins were re-numbered except where they were directly affected by the re-analysis (i.e., entire basins were not re-numbered) to provide best consistency with field data.

In the case of Duchess Lake, prior to field studies it was understood (based on National Topographic System Mapsheet 76D/09) that one continuous lake existed, with a narrows in between the east and west portions. However, field studies confirmed an elevation drop between two separate lakes. The western lake was designated as Lake Af1, while the eastern lake continued to be designated as Duchess Lake. Both lakes are designated as being located within sub-basin Af1, and Duchess Lake drains to Lac du Sauvage basin Ae1.

D1.2 Basin Map

A detailed map of the Lac du Sauvage and Paul Lake basins is provided in Map D-1.

D1.3 Basin Characteristics

Tabulated basin data are presented in Tables D-1 to D-12, including the following information:

- **Sub-basin name:** This name corresponds to the name of the primary lake (i.e., surface area greater than 4 hectares [ha]) in the sub-basin.
- **Terminal lake name:** This name generally corresponds to the name of the primary lake in the system, except in rare instances where the primary lake may drain through a much smaller (i.e., surface area less than 4 ha) to a downstream basin.
- **Names of small tributary lakes:** Names of lakes within the sub-basin with surface areas less than 4 ha. These lakes were not included as storage elements in hydrological models, though surface areas were accounted for in calculations of direct precipitation and lake evaporation.
- **Lake area:** Surface area (ha) of the named lake.
- **Sub-basin land area:** Total land area within the sub-basin.
- **Sub-basin total area:** Total of land area plus terminal lake area plus tributary lake area within the sub-basin.
- **Drains to sub-basin:** Indicates the name of the sub-basin to which this sub-basin drains.

These data were generated by Geographic Information System analysis of the LiDAR data collected during the 2013 field program, as archived on the Golder Associates Ltd. data repository.
