1.0 INTRODUCTION

De Beers Canada Inc. (De Beers) is proposing to develop the Gahcho Kué Project (Project), a diamond mine in the Northwest Territories (NWT). The Project is located in the North Slave region of the NWT at Kennedy Lake, approximately 140 kilometres (km) northeast of Łutselk'e and 280 km northeast of Yellowknife.

Baseline studies have been conducted to support the Environmental Impact Assessment for the Project and the Environmental Impact Review (EIR) Process. These data were reported in the December 2010 EIS (De Beers 2010). Baseline data reported in the 2010 EIS are sufficient to support the environmental assessment within the EIS. However, De Beers is committed to ongoing data collection in advance of regulatory approval of and the permitting process for the Project. As such, supplemental baseline data have been collected in 2011, and will continue to be collected and reported annually, until such time that these activities are no longer required prior to Project construction or evolve into future monitoring programs associated with an approved Project.

The purpose of collecting and reporting the supplemental baseline data for the Project is to support a consistent and transparent baseline program. In general, the goals of the supplemental data collection are to:

- reduce uncertainty and increase the level of confidence in impact predictions;
- broaden the baseline areas of investigation; and
- contribute to long-term future monitoring and adaptive management of the Project.

The focus of the 2011 supplemental data collection reported herein is climate and hydrology. Baseline data collection in 2011 were intended to expand the set of data collected in the area during previous field programs to characterize hydroclimate and hydrological parameters relevant to the Project

Climate and hydrology baseline investigations conducted by Golder Associates Ltd. (Golder) in 2011 were divided into the following components:

- Climate data collected at the Project site included daily and monthly temperature and rainfall from May 26 to September 15, 2011. On August 24, 2011, a new weather station was installed at the Project site and was programmed to measure and record the following parameters: air temperature, soil temperature at 0.3 m depth, air humidity, net shortwave and longwave radiation, atmospheric pressure, and wind speed and direction.
- Snow course surveys to estimate the snow water equivalent inside the Kennedy Lake watershed available for runoff during spring time.
- Development of hydrographs from 2011 data at nine hydrometric stations including:

Lake A3;	Lake N9;	Lake N17;
Lake D1;	Lake N11;	Lake N18; and
Lake L1;	Lake N14;	Kirk Lake.

- Development of bathymetric maps for 13 lakes including:

Lake B1;	Lake F1;	Lake I1;
Lake B2;	Lake G1;	Lake I2; and
Lake D7;	Lake G2;	Lake J1.
Lake E2;	Lake H1a;	
Lake E3;	Lake H1b;	

- Identifying the watershed boundaries and flow paths inside two new watersheds, to evaluate the suitability of a proposed new reference lake for the Project.

2.0 METHODS

2.1 Air Temperature

Air temperature at the Gahcho Kué Camp climate station was recorded using an Optimum Instruments Model TSW-5K sealed temperature sensor with radiation shield, and with a sampling interval of 15 minutes. The temperature record was used to derive mean daily and mean monthly temperatures for the period of May 26 to September 15, 2011. The location of the temperature gauge at the Gahcho Kué Camp climate station is shown in Appendix A, Figure A-1.

2.2 Rainfall

Rainfall at the Gahcho Kué Camp climate station was recorded using a tipping bucket rain gauge programmed to record the total amount of rain within each 15 minute period. The recorded rainfall data were used to derive total daily and monthly rainfall for the period of May 26 to September 15, 2011. The location of the rain gauge at the Gahcho Kué Camp climate station is shown Appendix A, Figure A-1.

2.3 Snow Course Survey

Snow course surveys to determine the late spring snow water equivalent (SWE) were conducted between April 4 and 8, 2011. Terrain type classification was defined by AMEC, and is presented in the 2010 EIS (De Beers 2010). For each watershed, proportions of terrain type are presented in Appendix B, along with raw survey data.

Late winter measurements of snow depths and snow densities were performed to characterize the amount of SWE available to contribute to spring runoff, over a range of terrain types. The water equivalent of a snowpack (the equivalent depth of water if the snowpack melted) is the product of snow depth and snow density. Snow course surveys to determine the late spring SWE were conducted between April 4 to 8, 2011 using the following methods:

2.3.1 Plot Selection

Plot locations within the Project area were selected and sampled based on the terrain type. The terrain types included the following:

Crest;	Northwest Slopes, 10 to 33 degrees;
Lake;	Northwest Slopes, > 33 degrees;
Lake Edge;	Southeast Slopes, 10 to 33 degrees;
Low Slopes;	Southeast Slopes, > 33 degrees; and
Northeast Slopes, 10 to 33 degrees;	Southwest Slopes, 10 to 33 degrees.
Northeast Slopes, > 33 degrees;	

This was done to identify differences in snow accumulation between terrain types. A total of 32 plots were selected in 2011 (Appendix B, Figure B-1) to cover all the terrain types and were evenly distributed within Kennady Lake watershed.

2.3.2 Snow Depth Measurement

A total of 22 transects were selected for snow depth survey. The majority of them coincide with the previous snow survey transects defined by AMEC and a few transects were added to evenly distribute them over the entire Kennady Lake watershed. Snow depths were measured along each transect on intervals of 10 m, by driving a snow metre probe into the snowpack and reading the depth on the probe.

2.3.3 Snow Density Measurement

Two density measurements were recorded at each plot site using a snow density sampler. The sampler was carefully inserted to avoid compacting the snowpack. Snow depth was recorded when the corer reached the soil surface. The corer was then pushed farther into the ground to ensure that a plug of soil was extracted with the sampler to prevent granular snow from falling out. After extracting the sampler and carefully removing the soil plug, the snow mass was measured by calculating the difference between the sampler weight with and without the snow core. These measurements were later used to calculate the snow water equivalent of the sample.

2.4 Flow Path Surveys

The suitability for a new reference lake was examined in two different watersheds located east and south of the Project area with no flow disturbances from the Project. The lake located south of the Project area is identified as Lake X6 and the lake located east of the Project area is identified as Reference Lake. The objective of the work was to define each watershed by ground-truthing flow paths. Geodetic water surface elevations of Lake X6, Reference Lake and surrounding major tributary lakes in both watersheds were surveyed on August 19, 2011, using a high accuracy global positioning system (GPS) SOKKIA GSR2700 ISX Real Time Kinematics (RTK) system.

2.5 Hydrometry

Continuous measurement stations were set up during the first field trip between May 24 and 27, 2011, for 9 hydrometric stations: Lake A3, Lake D1, Lake L1, Lake N9, Lake N11, Lake N14, Lake N17, Lake N18 and Kirk Lake. The data were used to develop stage-discharge relationships for the open-water season and to observe the outlet opening timing during the spring melt period. The stations were equipped with pressure transducers coupled with data loggers. Manual discharge and water level data measurements were also collected at these stations during each site visit. The location of each hydrometric station is shown in Appendix A, Figure A-1.

Hydrographs for all nine locations were derived using the following methods:

- A Keller Acculevel Submersible Level Transmitter solid-state pressure transducer and Optimum Instruments DD-520 data logger were installed, at each hydrometric station. Each data logger was programmed to record water pressure measurements at 15 minute intervals. Each station was referenced to an elevation benchmark.
- The transducers were installed before the start of spring melt, as permitted by ice conditions and site access.

- Manual water surface elevations were surveyed from the permanent benchmark using a rod and level, and the pressure transducer readings were recorded during selected data logger downloads.
- The stream discharge measurements were performed according to the Water Survey of Canada standard described by Terzi et al. (1994) during the first and subsequent visits to stations with flowing water. Velocity and depth measurements, used to calculate discharge, were collected using a Marsh McBirney 2000 Flo-Mate™ velocity meter and top-setting wading rod.
- The data loggers at each station were downloaded during each site visit and pressure transducer readings corresponding to each discharge measurement were recorded.
- The pressure transducers and data loggers were removed during the last site visit.
- The record of water surface elevations versus discharge was used to establish a stage-discharge rating curve for each station, when all data were available for flowing water stations. This rating curve was then applied to the continuous record of water surface elevations, as measured by the pressure transducer and recorded by the data logger at each station, to derive a continuous record of discharges.

2.6 Bathymetry

Bathymetric data were collected for 13 lakes (including Lake B1, Lake B2, Lake D7, Lake E2, Lake E3, Lake F1, Lake G1, Lake G2, Lake H1a, Lake H1b, Lake I1, Lake I2, and Lake J1) during a field trip between July 17 and 23, 2011, using the following instruments and methods:

- A Garmin GPSMAP® 531S Sounder mounted on a zodiac boat was used to perform the bathymetric surveys and provide an accurate three dimensional position.
- Spacing of the bathymetric transects depended on the size of each lake and the irregularity of the lake bottom. In general, one longitudinal transect, connecting the two farthest shorelines, was surveyed, with subsequent cross transects (i.e., perpendicular to the longitudinal transect) spaced evenly at a minimum of 5% of the lake length.
- Bathymetric data were collected during calm weather to reduce errors associated with waves on the lakes.
- Bathymetric maps were produced using ArcGIS software.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

3.0 RESULTS

3.1 Air Temperature

Temperature data were collected at the Project site from May 26 to September 15, 2011 and are presented in Table 1 and Figure 1, with daily data presented in Appendix C. Table 1 shows a comparison of mean monthly, maximum daily and minimum daily temperatures between the Project site and the Meteorological Service of Canada (MSC) Yellowknife A (MSC Station No. 2204100) and Lutselk'e (220L001) climate stations for the monitoring period (Environment Canada 2011). Figure 1 shows a comparison of mean daily temperatures between the Project site, Yellowknife A and Lutselk'e for concurrent records.

Temperatures at the Project site followed the same trend as those at Yellowknife A and Lutselk'e from May to September 2011, with distinctly lower temperatures in the months of May and June. The maximum recorded temperature of 25.9°C occurred in July and the minimum temperature of - 4.8°C, in May.

Locations of the Yellowknife A, Lutselk'e and local climate stations are presented in Table 2.

Table 1: Recorded Mean Daily Temperature Statistics at Gahcho Kué, Yellowknife A and Lutselk'e in 2011 (May 26 to September 15)

Month	Mean Monthly			Maximum Daily			Minimum Daily		
	Gahcho Kué	Lutselk'e ^{(a)(b)}	Yellowknife A ^(a)	Gahcho Kué	Lutselk'e ^{(a)(b)}	Yellowknife A ^(a)	Gahcho Kué	Lutselk'e ^{(a)(b)}	Yellowknife A ^(a)
May	5.1	11.4	10.9	14.1	17.0	19.5	-3.8	4.6	3.6
June	8.4	13.4	13.9	25.9	28.0	28.8	-4.8	-1.8	0.4
July	15.1	18.9	18.2	25.4	26.0	27.3	5.1	11.8	9.6
August	12.2	15.1	15.4	24.0	24.4	25.1	4.2	7.9	5.3
September	7.6	11.6	6.7	18.7	20.3	21.5	-0.5	3.2	0.7

^(a) Data reported by MSC has undergone only a preliminary quality check.

^(b) Based on available hourly data from MSC.

Table 2: Locations of the Gahcho Kué, Yellowknife A and Lutselk'e Climate Stations

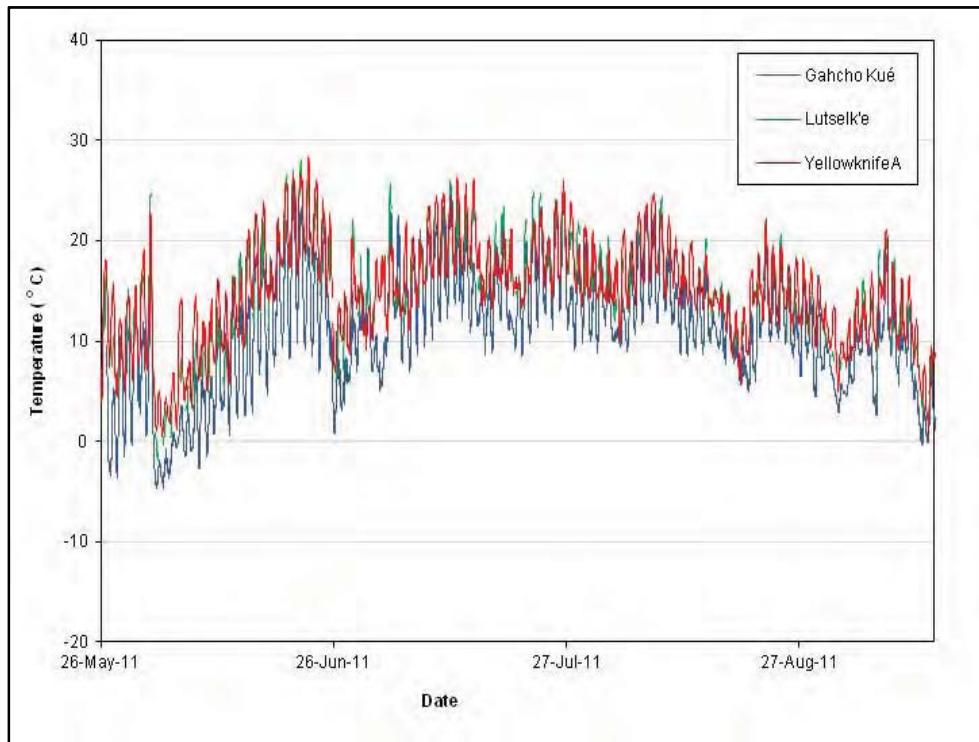

Station Name	MSC Station No.	Latitude North	Longitude West	Distance and Direction from Gahcho Kué [km]	Elevation [m]	Period of Record
Gahcho Kué	-	63°26'	109°12'	0	430	1998 to 2005, 2010 to 2011
Lutselk'e	220L001	62°25'	110°40'	136 S	179	1999 to 2011
Yellowknife A	2204100	62°27'	114°26'	287 SW	206	1942 to 2011

Note: km = kilometre; m = metre.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

Figure 1: Recorded Hourly Temperatures at Gahcho Kué, Lutselk'e and Yellowknife A in 2011 (May 26 to September 15)

3.2 Rainfall

Rainfall data were collected at the Project site from May 26 to September 15, 2011 and are presented in Table 3 and Figure 2, with daily data presented in Appendix C. Table 3 shows a comparison of monthly and maximum daily rainfall between the Project site, Yellowknife A and Lutselk'e climate stations for concurrent records. Figure 2 shows a comparison of daily rainfall between the Project site, Lutselk'e and Yellowknife A for the monitoring period.

Based on concurrent records in 2011, the total recorded rainfall at the Project site was less than at Yellowknife A, but similar to Lutselk'e A, with a total of 100 mm. Maximum daily rainfalls were comparable at Gahcho Kué and Yellowknife A (12.4 mm and 17.0 mm), and greater at Lutselk'e A (27.8 mm). These values are reported as measured, and do not include undercatch adjustments. Undercatch factors reported in the 2010 EIS for rainfall are very close for Gahcho Kué and Yellowknife A with values of 1.14 and 1.15. There is no value reported for Lutselk'e, although it is thought that the undercatch factor would be similar to that at Yellowknife A, because of proximity and similar latitudes.

Although the 2010 EIS reports the Yellowknife A and Lupin A (23026HN) climate stations as being most representative of precipitation at the Project site, the collected data were not compared to Lupin A due to frequent data gaps at that station in the 2011 record. The collected data were also compared to Lutselk'e as it is the closest station with a concurrent record for 2011.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

Table 3: Recorded Daily Rainfall at Gahcho Kué, Lutselk'e, and Yellowknife A in 2011 (May 26 to September 15)

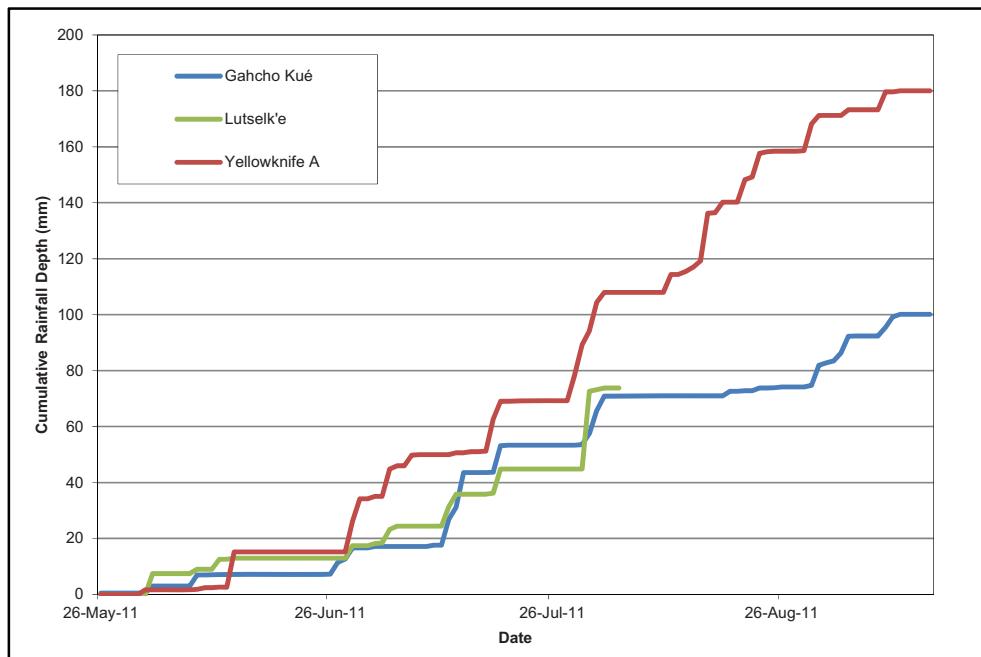

Month	Monthly Rainfall [mm]			Maximum Daily Rainfall [mm]		
	Gahcho Kué	Lutselk'e ^(a)	Yellowknife A ^(a)	Gahcho Kué	Lutselk'e ^(a)	Yellowknife A ^(a)
May	0.5	0.0	0.0	0.5	0.0	0.0
June	16.1	17.4	34.2	4.1	7.4	12.6
July	40.9	55.2	60.0	12.4	27.8	11.4
August	24.4	1.2	77.0	8.1	0.6	17.0
September	18.2	- ^(b)	8.8	5.9	- ^(b)	6.4
Total	100.1	73.8	180.0	12.4	27.8	17.0

^(a) Data reported by MSC have undergone only preliminary quality check.

^(b) Data not reported by MSC at the time of the analysis.

Note: mm = millimetre.

Figure 2: Cumulative Daily Rainfall at Gahcho Kué, Lutselk'e, and Yellowknife A in 2011 (May 4 to September 16)

3.3 Snow Course Survey

Wind redistributes snowfall over the course of a winter, and in general, exposed surfaces such as open lakes areas, collect less snow than sheltered lowland areas. Similarly, prevailing winds redistribute snow unequally across slopes of differing aspect. These effects may result in significant snow accumulation differences between terrain types.

Snow depth and densities were measured at 32 plots over 11 terrain types during the snow course survey. Table 4 presents, by terrain type, the snowpack measurement data collected in April 2008.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

For each terrain type, a mean SWE was calculated and used to derive the SWE for each sub-watershed based on the proportion of that terrain type over the entire sub-watershed as presented in Table 5. The mean SWE was measured at 118 mm for the 2010 to 2011 winter season.

Table 5: Average Snow Water Equivalent per Terrain Type

Terrain Type	Average Density [g/cm ³]	Average Depth [cm]	Average SWE [mm]
Low Slope	0.236	48.3	113
Crest	0.240	27.4	66
SE Slopes (10-33 degrees)	0.316	109.8	348
NE Slopes (10-33 degrees)	0.274	78.1	214
NW Slopes (10-33 degrees)	0.219	35.2	77
SW Slopes (10-33 degrees)	0.271	54.7	148
Lake Edge	0.279	58.9	164
Lake	0.202	21.2	43
NE Slopes (>33 degrees)	0.273	92.7	253
SE Slopes (>33 degrees)	0.295	156.6	462
NW Slopes (>33 degrees)	0.211	103.6	218

Notes: g/cm³ = grams per cubic centimetre; cm = centimetre; mm = millimetre; SWE = Snow Water Equivalent.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

Snow survey data were collected in various locations in the Snare and Yellowknife basins west of the Gahcho Kué region, and in the Taltson basin south of Great Slave Lake, by Indian and Northern Affairs Canada (now called Aboriginal Affairs and Northern Development Canada) (AANDC 2011). Table 6 presents snow water equivalents measured in 2011 and mean annual snow water equivalent values for the 10 closest stations to the Project area with available data in 2011.

Snow water equivalents for the selected regional stations varied between 58 and 137 mm. All stations reported SWE less than the long term mean in 2011 with the exception of two stations in the Taltson basin.

Table 6: Regional Snow Survey Data Summary

Station	Name	Basin	Location			Period of Record	Gap	SWE [mm]	
			Longitude	Latitude	Elevation [m]			Mean	2011
07SB-SC02	Tibbitt Lake	Yellowknife	113.38 W	62.50 N	244	1981 to 2011	-	82	58
07SB-SC04	Allan Lake	Yellowknife	113.05 W	62.95 N	297	1989 to 2011	-	91	74
07SB-SC05	Denis Lake	Yellowknife	112.62 W	63.37 N	411	1989 to 2011	-	115	73
07SB-SC06	Little Latham Lake	Yellowknife	113.63 W	63.20 N	305	1989 to 2011	-	101	73
07SB-SC07	Nardin Lake	Yellowknife	113.85 W	63.51 N	366	1989 to 2011	-	111	84
07SB-SC08	Sharples Lake East	Yellowknife	112.82 W	63.90 N	369	1989 to 2011	-	113	77
07SA-SC08	Big Lake	Snare	112.93 W	64.80 N	n/a	1995 to 2011	1997	132	100
07QD-SC02	Nonacho Lake	Taltson	109.67 W	61.72 N	320	1965 to 2011	1976 to 1977	107	80

07QD-SC04	Gray Lake	Taltson	108.30 W	61.80 N	320	1965 to 2011	1976 to 1977	107	137

Notes:m = metre; mm = millimetre; n/a = not available.

3.4 Flow Path Surveys

In the Lake X6 watershed, surveyed elevations ranged from 429.08 m in a headwater lake west of Lake X6 to 417.52 m at the outlet of Lake X6. Based on the National Topographic Data Base the estimated watershed area for Lake X6 is 39.4 km².

In the Reference Lake watershed, surveyed elevations ranged from 417.67 m in a headwater lake south of Reference Lake to 398.74 m at the outlet of Reference Lake. Based on the National Topographic Data Base the estimated watershed area for Reference Lake is 25.8 km².

Surveyed elevations and resulting channel flow path directions are presented in Appendix D, Figures D-1 and D-2.

3.5 Hydrometry

Factsheets describing the location of the hydrometric stations and equipment installed are provided in Appendix A. The appendix also contains stage-discharge data, the derived stage-discharge rating curve based on data collected in 2011, tabulated mean daily discharge and water level data, manual discharge measurement data and related calculation sheets for each station.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

3.5.1 Lake A3 and Outflow

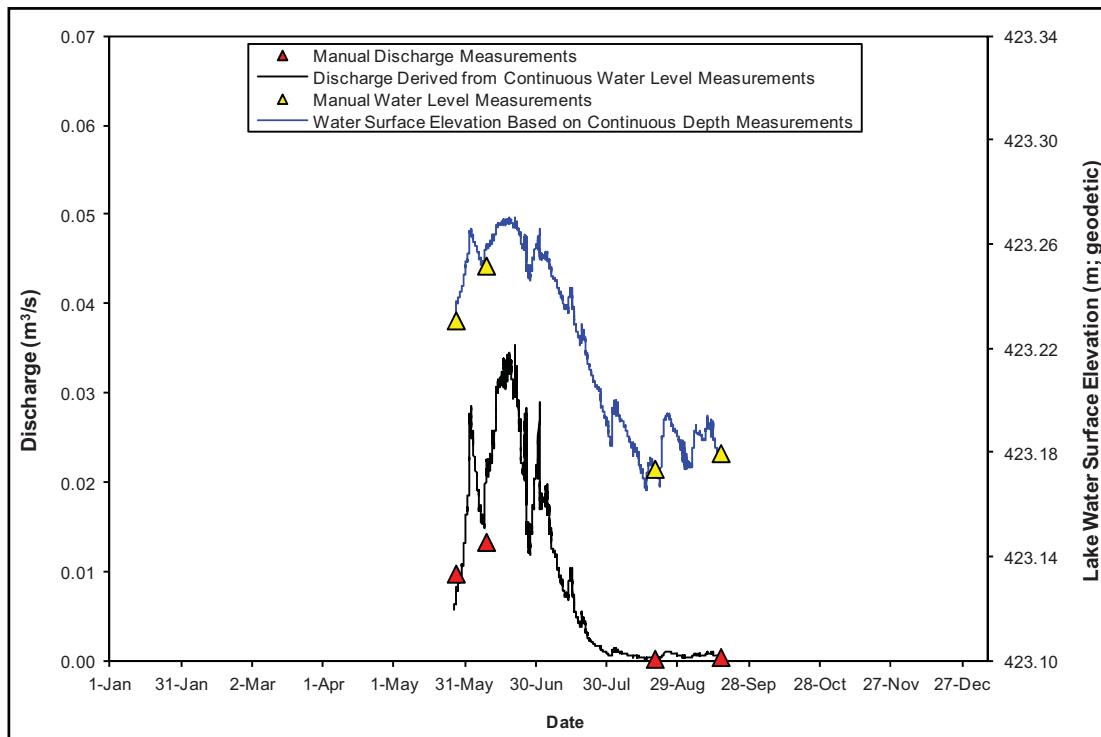

The Lake A3 and Outflow hydrometric station was visited four times in 2011, and a continuous hydrograph was derived for the period of May 26 to September 15, 2011, based on continuous logger data. Details of each site visit are provided in Table 7. The hydrographs for Lake A3 and Outflow are presented in Figure 3.

Table 7: Site Visits to Lake A3 and Outflow Hydrometric Station, 2011

3.5.3 Lake L1 and Outflow

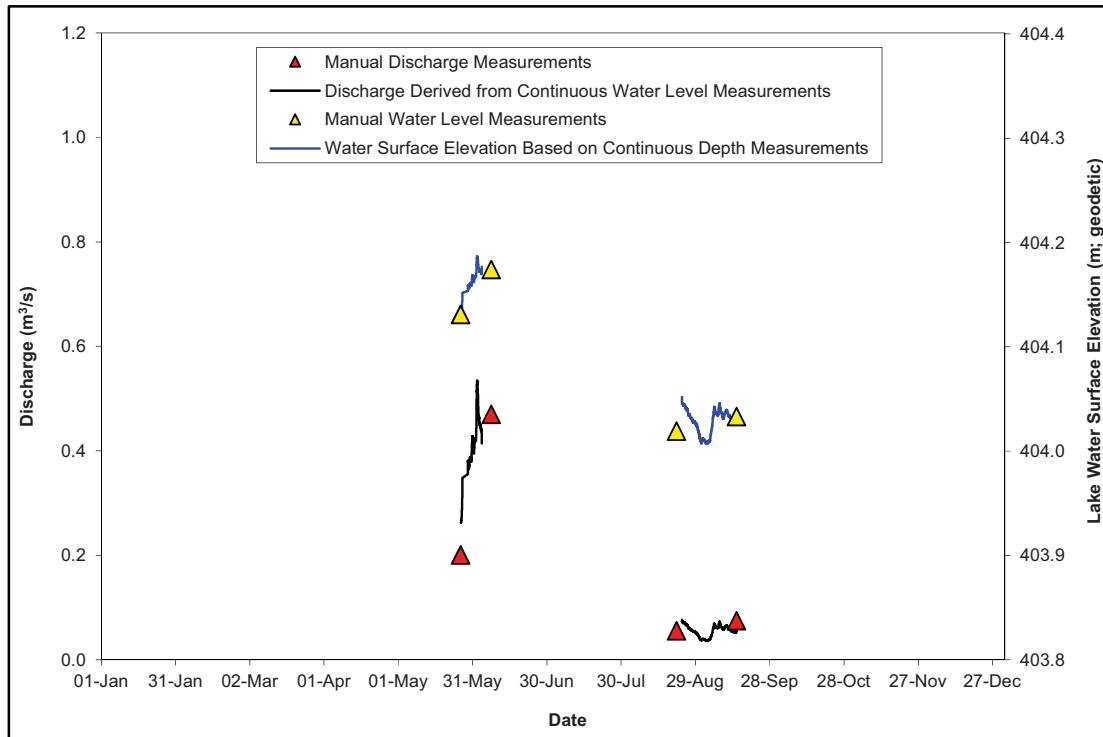

The Lake L1 and Outflow hydrometric station was visited four times in 2011, and a continuous hydrograph was derived for the period of May 26 to September 14, 2011, based on continuous logger data. Details of each site visit are provided in Table 9. The hydrographs for Lake L1 and Outflow are presented in Figure 5. Data were not recorded between June 4, 2011 and August 22, 2011 because of data logger malfunction. The data logger was replaced on August 23, 2011.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

3.6 Bathymetry

During the 2011 open water season, depth data were collected to prepare bathymetric maps for 13 lakes and the bathymetric maps for each lake are presented in Appendix E. The data were collected during single field trip between July 17 and 23, 2011.

Because of the timing when the depth data were collected and the water level variation during the open water season, the use of calculated volumes needs to take into consideration the variation in water level specific to each lake between the start and the end of the open water season, as these volumes can vary during a normal open water season. The surveyed water level at the time of data collection is presented on each bathymetric map. Table 16 presents the calculated volumes for the lakes surveyed during the open water season in 2011, together with the date of survey and measured water level.

Table 16: Lake Volumes Calculated from Measured Bathymetry

Lake Name	Date	Area [m ²]	Volume [m ³]	Maximum Depth [m]
Lake B1	July 22, 2011	83,534	145,245	5.0
Lake B2	July 22, 2011	65,813	59,698	1.8
Lake D7	July 23, 2011	375,858	578,126	5.0
Lake E2	July 22, 2011	28,697	15,675	0.6
Lake E3	July 22, 2011	10,974	4,391	1.1
Lake F1	July 19, 2011	42,682	59,497	6.8
Lake G1	July 19, 2011	26,905	20,255	1.9
Lake G2	July 19, 2011	54,448	87,068	3.8
Lake H1a	July 18, 2011	29,676	27,163	1.9
Lake H1b	July 18, 2011	28,044	39,849	2.9
Lake I1	July 18, 2011	129,748	498,033	11.0
Lake I2	July 18, 2011	19,539	9,738	1.3
Lake J1	July 17, 2011	491,408	679,390	4.2

Note: m² = square metres; m³ = cubic metres; m = metres.

2011 CLIMATE AND HYDROLOGY SUPPLEMENTAL MONITORING REPORT

4.0 SUMMARY AND CONCLUSIONS

The hydrometric program for the 2011 field season included nine hydrometric stations, with all with sensors recording the water level every 15 minutes. Temperature and precipitation data were collected as part of the 2011 hydrometric program.

For the six hydrometric stations with continuous discharge hydrographs, including Lake A3, Lake D1, Lake N14, Lake N11, Lake N18 and Lake N9, the water yield for the open water season was calculated based on derived daily values and is presented in Table 17.

Table 17: Water Yield Values for the Automated Stations in the Project Area

Watershed	Watershed Area [km ²]	Runoff Volume [m ³]	Water Yield [mm]
A3 Watershed	0.768	89,700	116.8
D1 Watershed	4.497	213,200	47.4
N14 Watershed	0.975	60,500	62.1
N11 Watershed	114.688	6,351,300	55.4
N18 Watershed	1.630	72,900	44.7
N9 Watershed	5.168	369,000	71.4

Note: km² = square kilometres; m³ = cubic metres; mm = millimetres.

The comparison of water yields shows that the highest value was at A3 watershed and it is almost double than for the rest of the watersheds. This may be explained by the small watershed area and a late outlet channel opening, which caused most of the runoff to take place after the hydrometric station was installed and therefore most of the runoff was recorded.

For the remaining hydrometric stations, it likely that the recorded hydrographs do not capture the entire runoff and the peak flows, or a significant portion of the runoff occurred before the station was installed. It should be noted that for the hydrology of the area approximately 70% of the runoff typically occurs during the freshet period (which is usually 2 to 3 weeks long) and a few days with no recorded data during this period can significantly influence the calculated water yield values.

The 2011 hydrometric program still provides a great deal of useful information, including hydrographs and stage-discharge data that may be used for model calibration and validation, and information on seasonal lake water level variations.

8.0 GLOSSARY

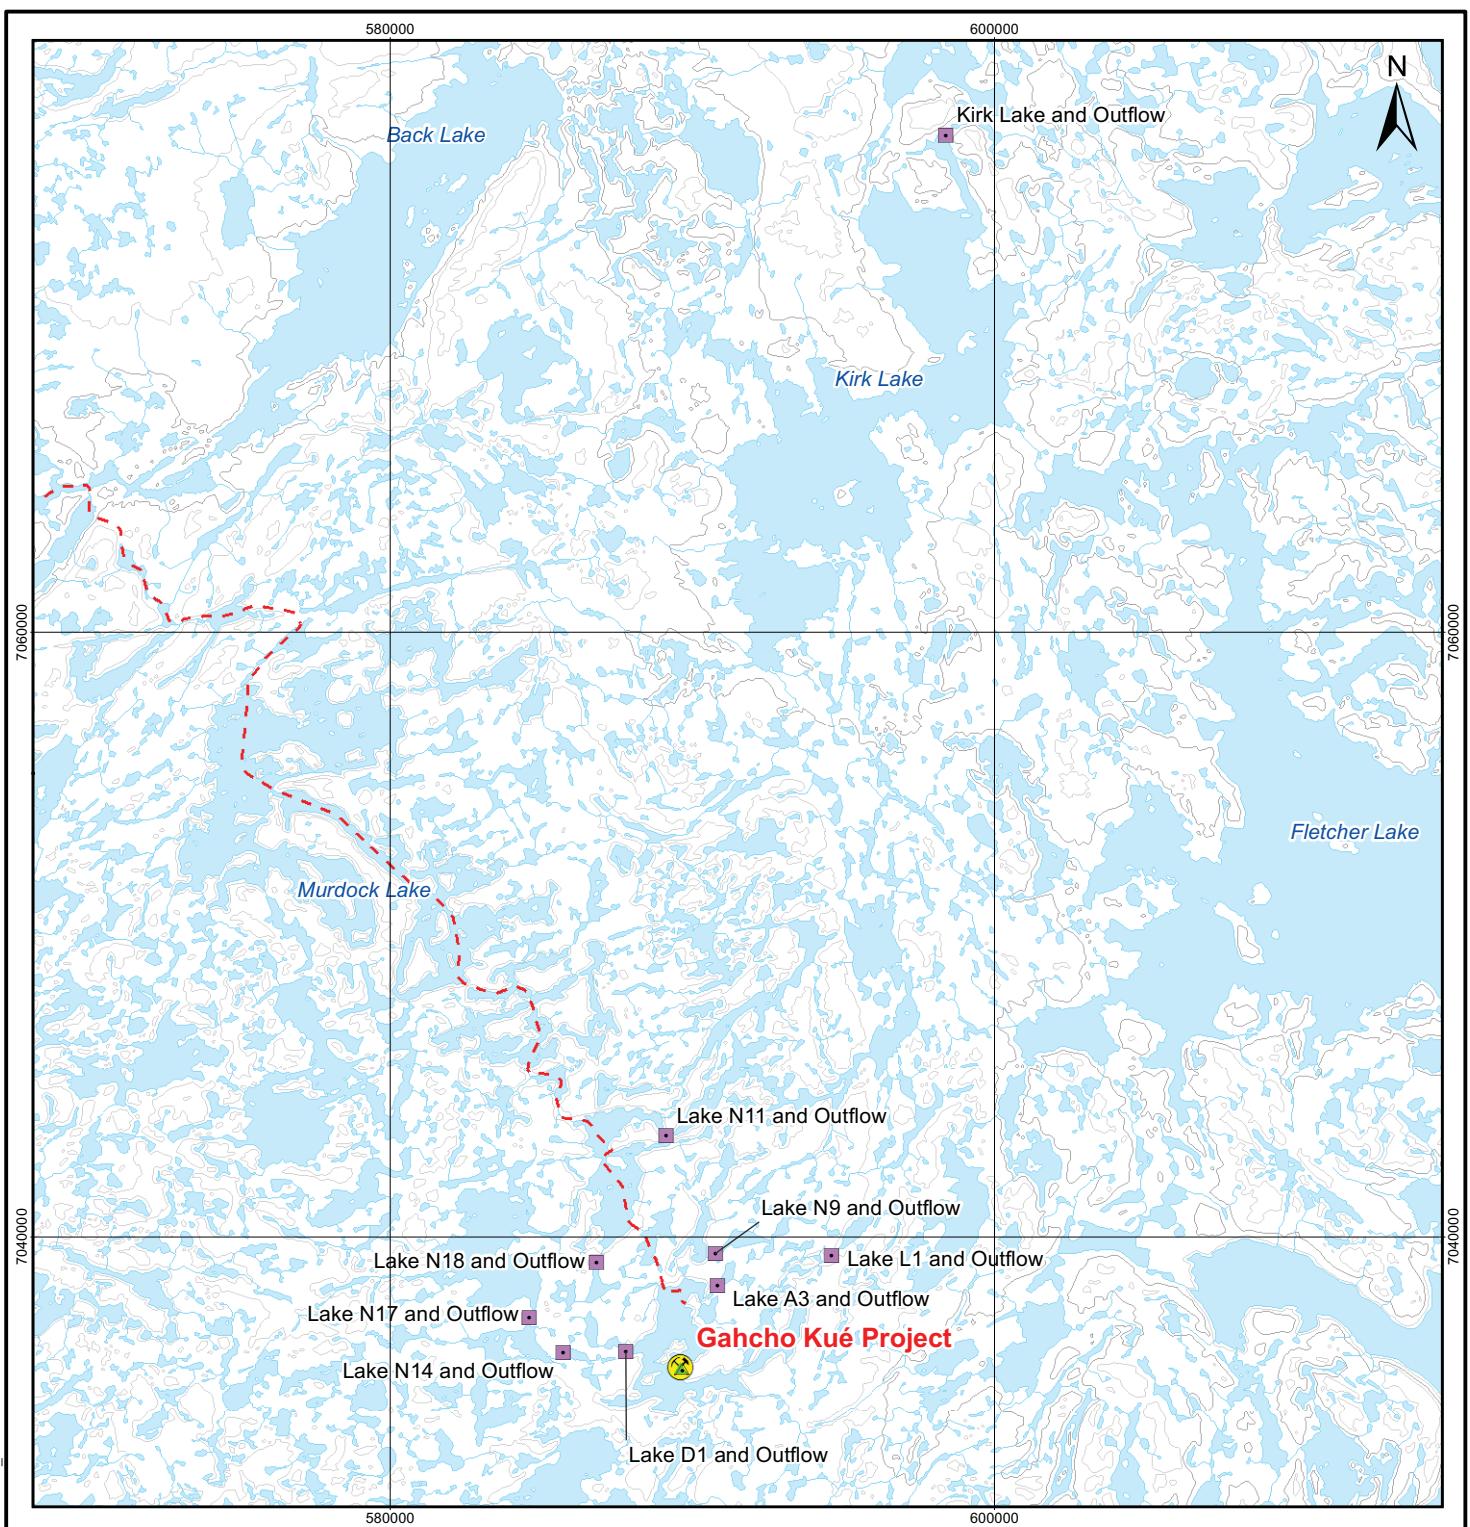

Baseline	Describes the current environmental setting, against which changes in the environment from the Snap Lake Diamond Project could be assessed; as there are no approved developments within the Regional Study Area (RSA), the baseline case focuses on summarizing the available monitoring data gathered at the Snap Lake Diamond Project.
Bathymetry	Measurement of the depth of an ocean or large waterbody.
Effects	A noticeable change in the receptor beyond normal variability due to a chemical of concern or other stressor.
Freshet period	A thaw event resulting from melting snow and ice on rivers.
Geodetic	Coordinates (elevations) that are referenced to a coordinate system (i.e., UTM Zone 12) and are not assumed or local.
Geographic Information System (GIS)	A computer-based tool for analyzing, displaying and manipulating digital spatial data.
Ground-truthing	Visiting locations in the field to confirm or correct information produced from remote sources such as interpreted aerial photographs or classified satellite imagery.
Headwater lake	A lake with no significant tributaries, located in the upper reaches of a catchment.
Hydrograph	Graph showing discharge over time.
Local study area (LSA)	The geographic area selected for examining the direct effects of the project on or very near the proposed project's site location.
Mean	A value that is computed by dividing the sum of a set of terms by the number of terms.
Parameter	A particular physical, chemical, or biological property that is being measured in a waterbody; whatever it is you measure in a waterbody.
Regional Study Area (RSA)	The geographic area selected for examining the proposed project's potential effects within a context that extends beyond the Project site.
Snow water equivalent	The depth of water that would result from melting the snow accumulated in a given area.
Stage-discharge rating curve	An equation relating water surface elevation at a specific location to discharge rate at a specific location.
Transect	A method of sampling snow along a path or fixed line.
Undercatch	The phenomenon whereby a rain or snow gauge measures less than the actual precipitation. Wind turbulence can deflect precipitation from being captured by the gauge, trace events may be too small to measure and wetting of the gauge surface, followed by evaporation, can all cause measured values to be smaller than actual.
Waterbody	An area of water such as a river, stream, lake or sea.

1.0 HYDROMETRIC DATA FROM THE 2011 FIELD SEASON

1.1 Introduction

This appendix presents the hydrometric data collected during the 2011 field season. The following symbols and units are noted:

- m^3/s = cubic metres per second
- m/s = metres per second
- m = metres
- MIN = minimum
- MAX = maximum
- - = no available data
- P = partial
- LDB = left downstream bank
- BM = benchmark
- BM_read = survey reading on top of benchmark
- WL_read = survey reading for water level
- WL_Elev = water level elevation calculated after survey
- SN = serial number

LAKE A3 AND OUTFLOW HYDROMETRIC STATION

LAKE A3 FACTSHEET

LOCATION AND DETAILS

Located on the left downstream bank of Lake A3 outlet, approximately 3 kilometres northeast of Kennady Lake Exploration Camp.

Operational in 2011 from 25 May to 15 September

Benchmark: Bolt on boulder; 424.04 m (geodetic)

Coordinates: UTM: 590846 m E, 7038405 m N (NAD83, Zn12)

Lat/Long: 63°27'45" N, 109°10'39" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

LAKE D1 AND OUTFLOW HYDROMETRIC STATION

LAKE D1

FACTSHEET

LOCATION AND DETAILS

Located on the right downstream bank of Lake D1 outlet, approximately 2 kilometres west of Kennedy Lake Exploration Camp.

Operational in 2011 from 26 May to 15 September

Benchmark: Bolt on boulder; 423.538 m (geodetic)

Coordinates: UTM: 587822 m E, 7036241 m N (NAD83, Zn12)

Lat/Long: 63°26'36" N, 109°14'23" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

LAKE L1 AND OUTFLOW HYDROMETRIC STATION

LAKE L1

FACTSHEET

LOCATION AND DETAILS

Located on the left downstream bank of Lake L1 outlet, approximately 6 kilometres northeast of Kennady Lake Exploration Camp.

Operational in 2011 from 26 May to 14 September

Benchmark: Bolt on boulder; 405.552 m (geodetic)

Coordinates: UTM: 594589 m E, 7039431 m N (NAD83, Zn12)

Lat/Long: 63°28'14" N, 109°06'06" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

Lake L1 outlet view downstream towards right bank

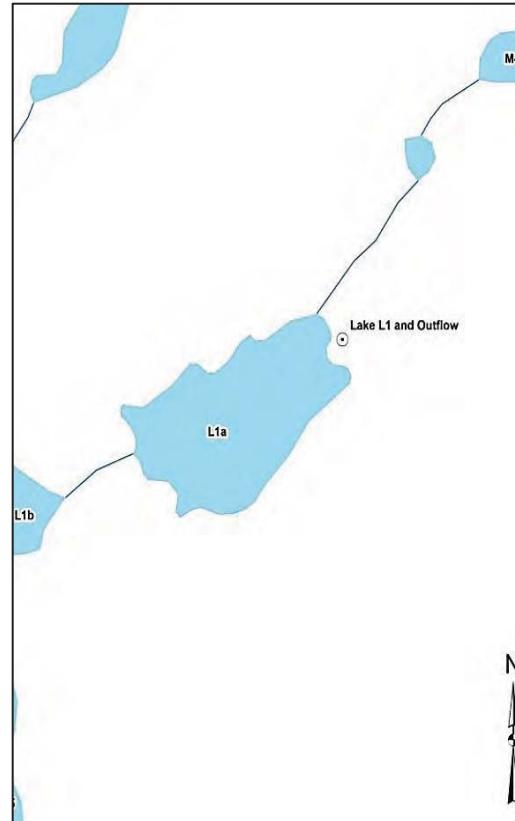

Lake L1 outlet view upstream towards left bank

Lake L1 outlet channel view downstream

Lake L1 left bank on 5 May 2010 at install time

LAKE N9 AND OUTFLOW HYDROMETRIC STATION

LAKE N9 FACTSHEET

LOCATION AND DETAILS

Located on the left downstream bank of Lake N9 outlet, approximately 4 kilometres northeast of Kennady Lake Exploration Camp.

Operational in 2011 from 25 May to 15 September

Benchmark: Bolt on boulder; 424.764 m (geodetic)

Coordinates: UTM: 590816 m E, 7039437 m N (NAD83, Zn12)

Lat/Long: 63°28'18" N, 109°10'39" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

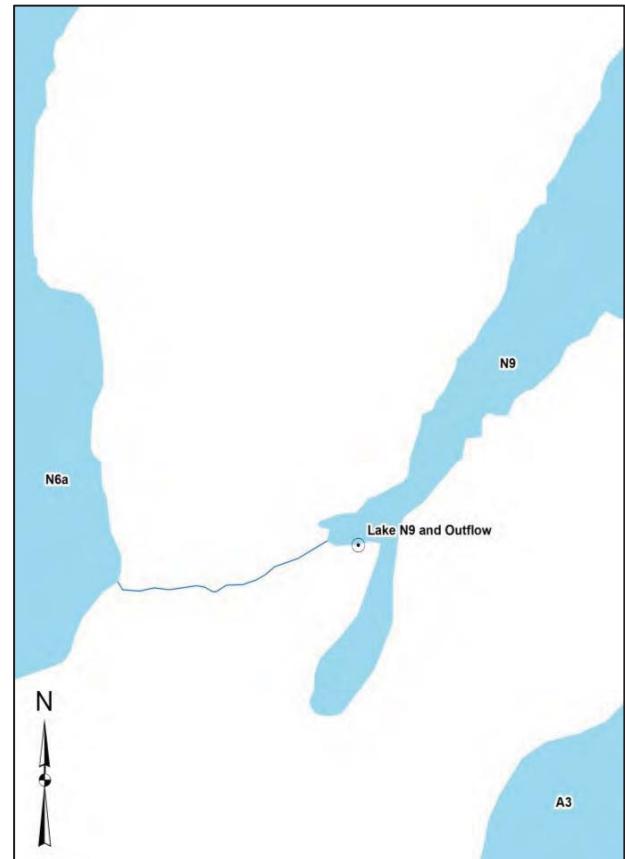

N9 Lake Outlet view north (flow from right to left), during spring freshet, 25 May 2011

View downstream of Lake N9 outlet at spring time

View upstream of Lake N9 outlet, September 2011

LAKE N11 AND OUTFLOW HYDROMETRIC STATION

LAKE N11

FACTSHEET

LOCATION AND DETAILS

Located on the right downstream bank of Lake N11 outlet, approximately 8 kilometres north of Kennady Lake Exploration Camp.

Operational in 2011 from 25 May to 14 September

Benchmark: Bolt on boulder; 100.000 m (non-geodetic)

Transducer: Keller Acculevel Submersible
Level Transducer

Coordinates: UTM: 589133 m E, 7043346 m N (NAD83, Zn12)

Datalogger: Optimum Instruments DD-520

Lat/Long: 63°30'26" N, 109°12'33" W

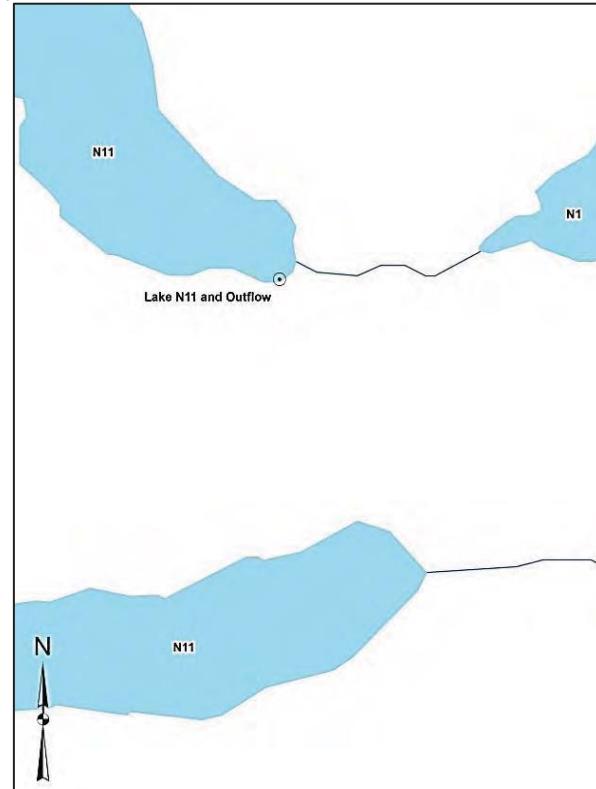

Lake N11 outlet channel panorama view downstream

Lake N11 outlet channel view upstream

Aerial view of Lake N11 outlet during melting, 5 May 2010

LAKE N14 AND OUTFLOW HYDROMETRIC STATION

LAKE N14

FACTSHEET

LOCATION AND DETAILS

Located on the south bank of Lake N14, 50 m upstream of the lake outlet and approximately 4 kilometres west of Kennedy Lake Exploration Camp.

Operational in 2011 from 26 May to 15 September

Benchmark: Bolt on boulder; 426.048 m (geodetic)

Coordinates: UTM: 585776 m E, 7036191 m N (NAD83, Zn12)

Lat/Long: 63°26'38" N, 109°16'49" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

LAKE N17 AND OUTFLOW HYDROMETRIC STATION

LAKE N17

FACTSHEET

LOCATION AND DETAILS

Located on the right downstream bank of Lake N17 outlet, approximately 5 kilometres west of Kennady Lake Exploration Camp.

Operational in 2011 from 26 May to 15 September

Benchmark: Bolt on boulder; 100.00 m (non-geodetic)

Coordinates: UTM: 584609 m E, 7037326 m N (NAD83, Zn12)

Lat/Long: 63°27'15" N, 109°18'11" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

LAKE N18 AND OUTFLOW HYDROMETRIC STATION

LAKE N18

FACTSHEET

LOCATION AND DETAILS

Located on the left downstream bank of Lake N18 outlet, approximately 4.6 kilometres northwest of Kennady Lake Exploration Camp.

Operational in 2011 from 26 May to 15 September

Benchmark: Bolt on boulder; 424.957 m (geodetic)

Coordinates: UTM: 586826 m E, 7039189 m N (NAD83, Zn12)

Lat/Long: 63°28'14" N, 109°15'26" W

Transducer: Keller Acculevel Submersible
Level Transducer

Datalogger: Optimum Instruments DD-520

KIRK LAKE AND OUTFLOW HYDROMETRIC STATION

KIRK LAKE FACTSHEET

LOCATION AND DETAILS

Located on the west bank of Kirk Lake, 200 m from the lake outlet, approximately 40 kilometres north of Kennady Lake Exploration Camp.

Operational in 2011 from 25 May to 15 September

Benchmark: Bolt on boulder; 100.000 m (non-geodetic)

Coordinates: UTM: 598397 m E, 7076449 m N (NAD83, Zn12)

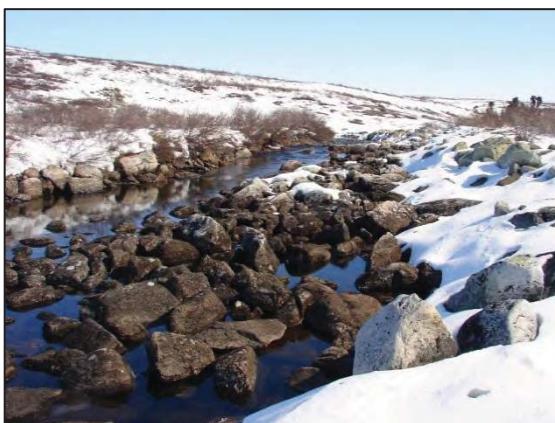

Lat/Long: 63°48'06" N, 109°00'08" W

Transducer: Keller Acculevel Submersible
Level Transducer

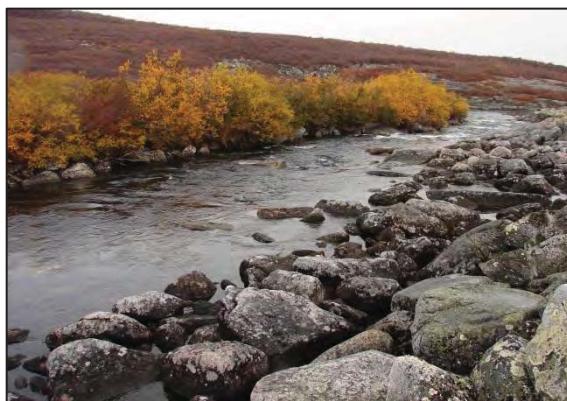

Datalogger: Optimum Instruments DD-520

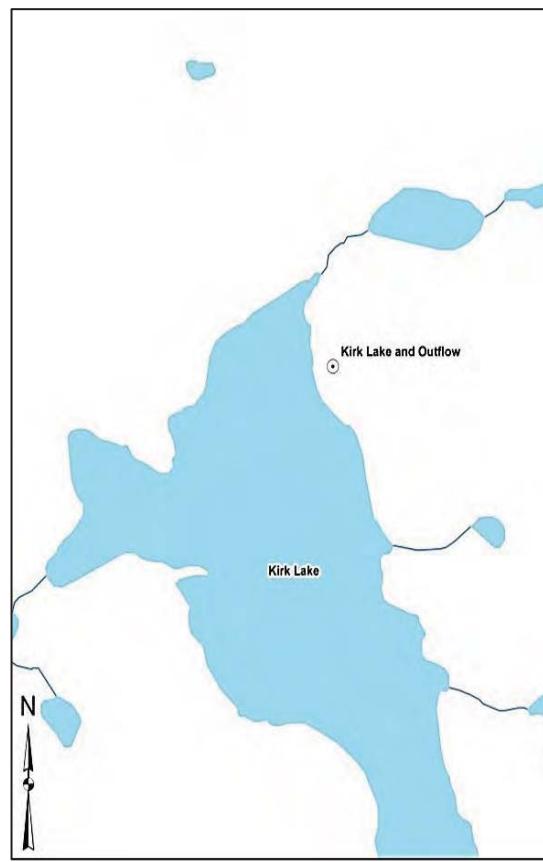

Kirk Lake panorama – upstream view towards lake from the outlet channel

Downstream view of the outlet channel during melting period

Downstream view from the discharge location

11.0 MISCELLANEOUS SITES

Discharge data were collected opportunistically for Kennady Lake, while doing other tasks from the hydrology program (e.g., bathymetry or lake shoreline surveys). These measurements are presented below.

REFERENCE LAKES FLOW PATHS SURVEY

The two proposed reference lakes were surveyed on 19 August 2011. The maps with the flow paths and water level elevations are presented in Figure D-1 for Lake X6 and Figure D-2 for Reference Lake.
